USERS FROM ANY
IDENTITY DATA
STORE

RAPID AND EASY
SHAREPOINT

VIS FOR SHAREPOINT CAN REDUCE ADMINISTRATION UP TO 90%

BENEFITS

Significantly Reduces Administration

Utilizing VIS for SharePoint's Virtual Dynamic Groups and Virtual Auto-Groups significantly reduces the administration of a SharePoint deployment. Security is configured once and effective permissions within SharePoint automatically change as data changes within the environment.

Increased Security and Governance

VIS for SharePoint further simplifies and increases the security within SharePoint by providing administrators a dynamic attribute-based access control security model for SharePoint.

Administrators are no longer required to manage security and group membership on an on-going basis. Instead, administrators define security once creating dynamic groups that are based on user based attributes. As the data changes on the user, so does the group member ship. The security within SharePoint is now defined once and changes ,automatically, significantly reducing administration, increasing security and lowering the total cost of ownership (TCO).

Multi-Repository Authentication

VIS for SharePoint enables organizations to rapidly deploy SharePoint to users regardless of the repository they reside. Using out-of-the-box adapters, VIS can authenticate and authorize users from a multitude of data stores, including all major LDAP directories (i.e. Active Directory, ADAM, AD LDS, Sun, eDirectory, etc.) and even databases.

Claims Based Authentication & Authorization

Using VIS for SharePoint, claims can now be dynamic in nature. Claims can be configured by user attributes that exist in multiple data stores, such as other LDAP directories or even databases.

Compliance, Auditing and Reporting

VIS for SharePoint includes a complete automated compliance engine that enables administrators to automate and secure their SharePoint environment. Additionally complete audit records and reports are built-in providing administrators the tools they need.

People-Picker / Claims Provider

Federated SharePoint deployments do not include the ability to search for users/groups, but VIS for SharePoint provides the searching ability across all of your identity stores.
