

## Who Is Most Affected by Ransomware?

Currently, ransomware is currently one of the most prevalent threats in the cybersecurity sphere, and it looks different for every business. Some businesses in certain sectors face higher levels of risk. This risk might be associated with factors like the nature of the company's data or how much it's willing to pay to keep operations moving.

## The Password Problem

With World Password Day next Thursday, we thought we would address the problems with passwords. The real problem only reveals symptoms, not the problem itself. Building a better solution starts with clearly defining the challenge. Let's take a look at the 5 criteria for a strong password.

## Typing Biometrics and Other Multi-Factor Authentication Methods

81% of data breaches are from weak, default or stolen passwords. Leveraging MFA when it's offered lessens the attack vector for digital identity impersonation attempts. This paper looks at existing MFA options, including biometric typing technology, examines decision factors for MFA and discusses the difference between various authentication methodologies.

## Identity Fabrics and the Evolution of Identity

An Identity Fabric architecture enables an organization to manage identity-related tasks like authentication, access control, and integration, through no-code workflows that ingest information from all platforms, process it, and route it to the services and apps necessary to fulfill the user's request. Its power is in its flexibility.

An Identity Fabric solution supports stronger cybersecurity by enabling the consistent enforcement of policies across infrastructures, and across distributed apps as well, while also making advanced identity controls such as multi-factor authentication (MFA) and passwordless authentication easier to implement.
